For Immediate Release

After months of prototyping, testing and development we are ready to release the latest “must have” part to hit the Karting scene in years. With the onset of the TaG formula as of late, the demand on 219 chains and sprockets is much more demanding than ever before. After hours of testing we have developed a Free Floating sprocket hub that self-aligns to keep the rear sprocket perfectly in line with the sprocket on the engine under load in cornering. This reduces drag and wear on all of the drivetrain components unleashing additional horsepower and reducing wear on all of the drivetrain components.

We have found it to be great for use in Comer 80 classes, TaG classes, and especially good in Road Race applications.

CNC Machined from Lightweight billet aluminum and black anodized for strength and durability, these units have been shown to have zero wear with over 1000 laps of use. The hub uses stainless steel floating pins to guide the motion of the sprocket flywheel. We have found over double the chain and sprocket life when compared with standard fixed type sprocket hub wear patterns.

Currently available in 30mm, 40mm, and 50mm in Brite dip Black finish to suit all chassis configurations. Look for more new Innovations from us in the near future to make your karting experience more successful. Suggested retail price starts at \$119.00. Dealer inquiries available.
